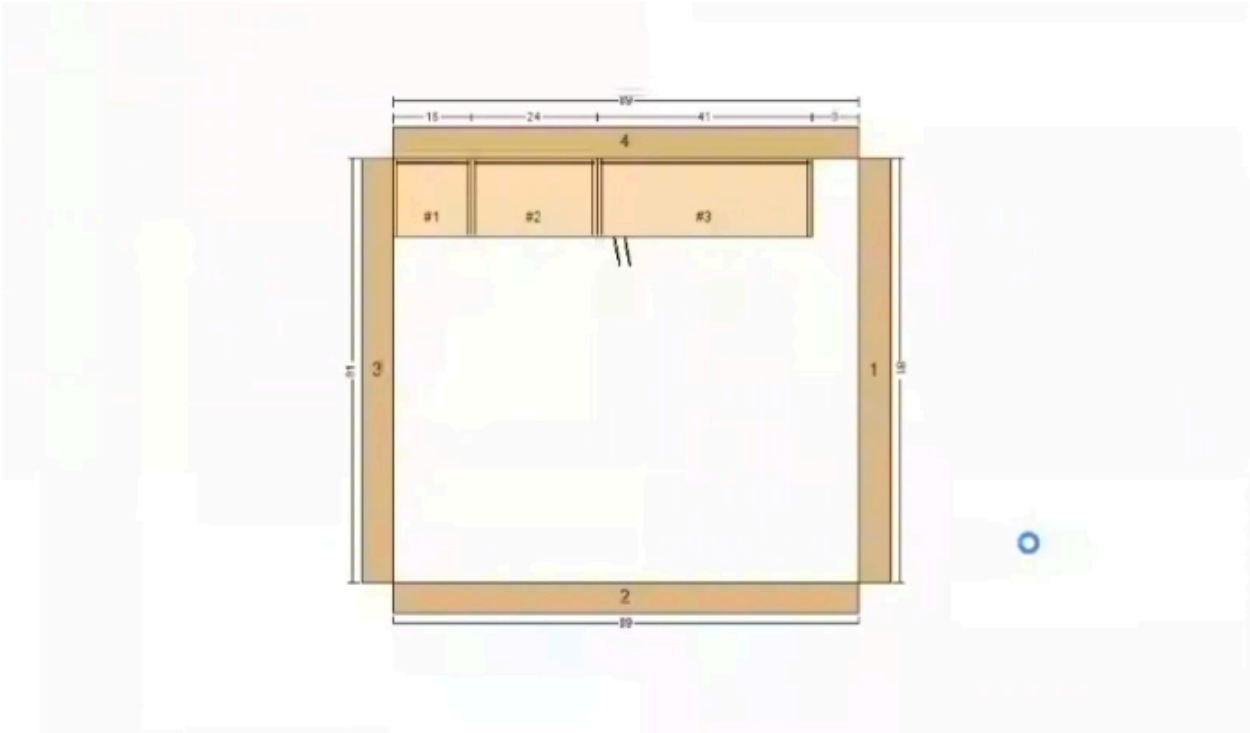
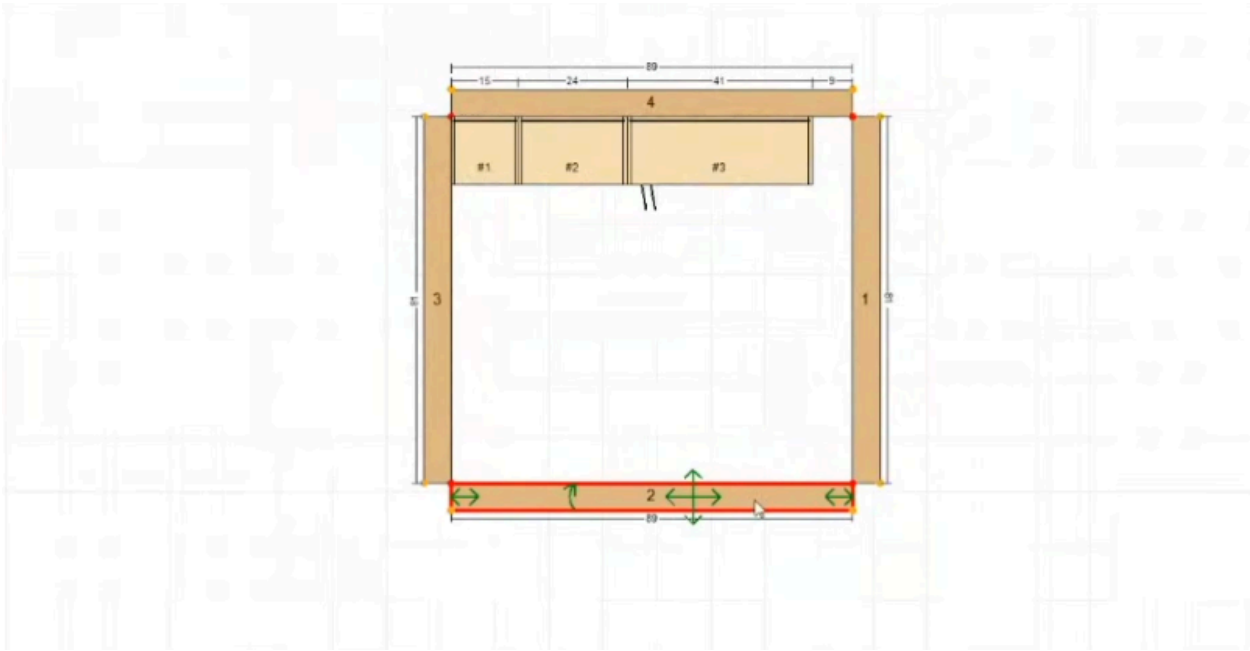
A closed room with all the walls connected each other looks like this:



Then I selected wall 2 and then it looks like this:



Now If I rotate, see how the entire room is getting rotated based on the pivot point of the selected wall. In our case to determine the pivot point we have to look at the wall from the inside of the room and we'll find the left corner of the selected wall is the pivot point.

See the pivot point is fixed, it doesn’t move and works as a center of the rotation. Then the entire room is rotating based on this fixed point. It doesn’t change the length of any wall or change the angle between any wall. Just rotate the room.
